Molecules

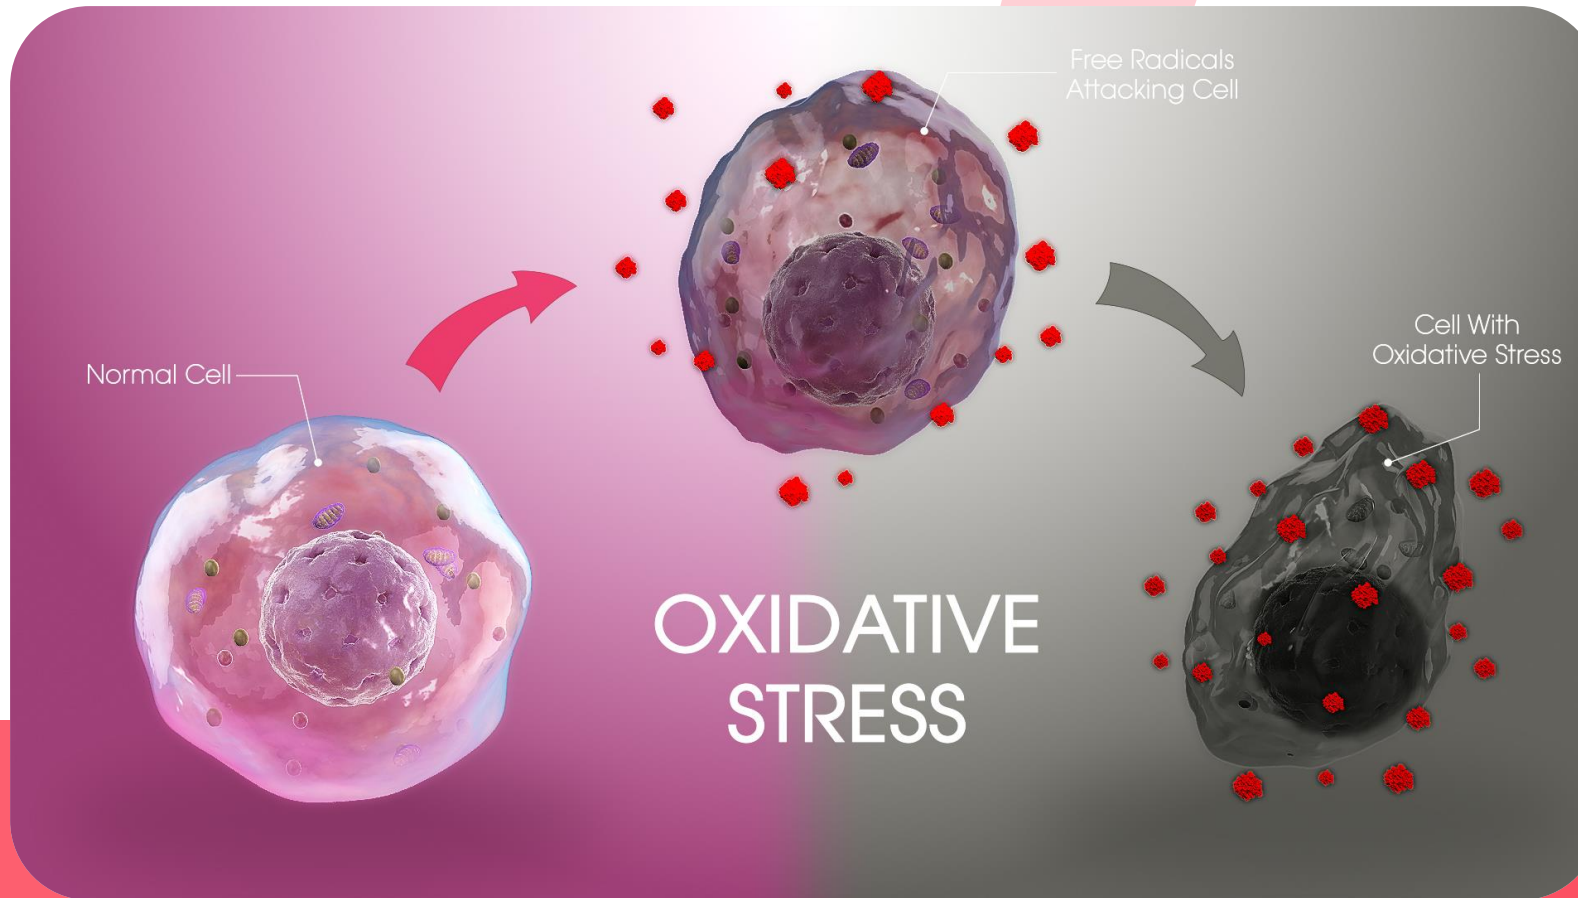

Unpaired Electron

Molecules with unpaired electrons are termed 'free radicals.'

Free radicals are oxygen-containing molecules with an uneven number of electrons. The uneven number allows them to easily react with other molecules. Free radicals can cause large chain chemical reactions in your body because they react so easily with other molecules. These reactions are called oxidation.

OXIDATIVE STRESS

Oxidative stress can cause chronic inflammation.. Oxidation can damage vital molecules in our cells, including DNA and proteins, which are responsible for many body processes. Molecules such as DNA are needed for cells to function properly, so if too many are damaged, the cell can malfunction or die.

OXIDATIVE STRESS

Causes hundreds of diseases to name a few...

Parkinson's Disease, Alzheimer's Disease, Leukemia, Stroke, Heart Attack, Diabetes, Fibroid, Ovarian Cyst, Arthritis
Down Syndrome, Cancer, Multiple Sclerosis, Rheumatoid Arthritis, Spinal Cord Injury, Paralysis, Brain Trauma
Congestive Heart Failure, High Blood Pressure, Orthopedic Injuries, Baldness, Deafness, Blindness, Glaucoma Bone
Marrow Transplant, Wound Healing, Kidney Stones And Failure, Prostate Enlargement Liver Diseases, Pancreatic
Dysfunction, Cardiovascular Diseases, Vision Impairment, Learning Defects, Skin Repair

Introduction of Cells

We have more than **100 trillions** of cells in our body and all those are in different types & Shapes

Generally, our cell lifetime is **90 to 120 days** depending on our age and metabolism

There are over **200 different cell types in the human body**. Each type of cells is specialized to carry out a particular function, either solely, but usually by forming a particular tissue.

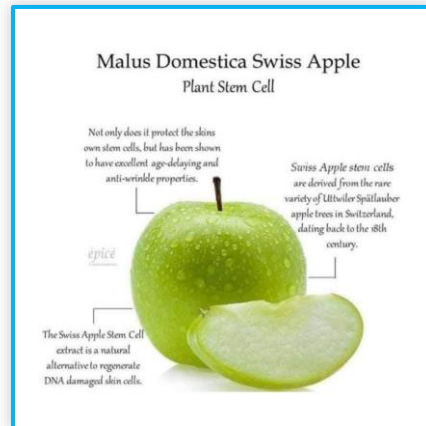

The Most Important types of cells are **listed below.**

- ✓ Stem cells
- ✓ Neuroglial cells
- ✓ Endothelial cells
- ✓ Red blood cells
- ✓ Muscle cells
- ✓ Epithelial cells
- ✓ White blood cells
- ✓ Cartilage cells
- ✓ Fat cells
- ✓ Platelets
- ✓ Bone cells
- ✓ Sex cells
- ✓ Nerve cells
- ✓ Skin cells

Introduction of Stem Cells

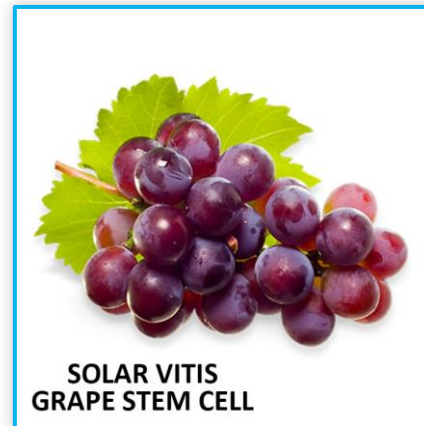

Before a cell becomes specialized, it first starts out as a stem cell. The unique feature of stem cells is that they are pluripotent - they have the potential to become any type of cell in the body.
